A Good Crop of Chilean Alfalfa

GOOD ALFALFA SEED SCARCE

The market price of alfalfa seed has steadily advanced since harvest time. A serious shortage of fifteen million pounds is reported by the United States Department of Agriculture, which has been the main factor in this rising market. On top of the short crop there has been a heavy demand caused by high prices for hay and the great amount of alfalfa that was winter-killed in the east.

We have been fortunate in securing an exceptional fancy grade of Northern California Chilean or Common seed this year and are in a position to furnish excellent stocks as long as the supply lasts.

If you are figuring on planting any alfalfa seed this spring we advise placing your order early to be sure of good seed. We anticipate a higher market for good quality seed. Come in and let us show you.

SPRING TIME IS SPRAYING TIME

The buds will soon be swelling and the spring spray will be necessary to check the curly-leaf, etc.

Old time orchardists agree that there is only about one day in the spring that is right for spraying. Spraying must be done at the right time to accomplish good results. Get your spray material now and have it on hand so there will be no delay when the proper time comes. We have a large stock of all kinds of spray ma-

PLANT A GARDEN

Agriculture has always been the leading occupation in California. No other state in the Union has such a climate and soil as California. While the greater part of the east is under a mantle of snow, Californians are in their garden enjoying the sunshine and warm weather nature has favored our Golden State with. It is for you to take advantage of this wonderful gift and plant a garden. A house can not become a home until it has a garden. We, in California are not limited to a few plants to sow early but any hardy annual or perennial may be sown after the first of February. A few cents' worth of seed will produce more than any other investment you may make. A vegetable garden pays good dividends if properly cared for. The dividends in health and happiness can not be measured in dollars and cents. On the second page you will find a list of the items that may be planted now. Study this list and decide what you wish in your garden. A call to our store for advice will be gladly replied to. We are always interested in the success of our customers.

materials on hand but sometimes near the last of the season our stock gets low. We like to clean up every year so there will not be any old material on hand the following year. You will assist us if you place your order now so it will be ready when you are. Remember there are hundreds of other growers that want to spray the same day that you do. Write for a spray chart. It is free.

USE MORE FERTILIZER —NOW IS THE TIME

During the winter and early spring months is the best time to apply any kind of fertilizer. If applied at this time the plant will have time to take up the food and an early spring growth will result.

For lawns and garden we recommend Mococo Fertilizer. It is a high grade commercial fertilizer, odorless, and contains no weed seeds. It is purely chemical. A fifty pound sack is plenty for the average home. For lawns apply at the rate of 4 lbs. to every hundred square feet. Be sure and water the lawn as soon as you put on the fertilizer. The water will dissolve the fertilizer and there will be no danger of burn. At the first signs of spring your lawn will become a rich velvety green. Constant feeding is as necessary to a plant as food is to any living thing. Poor deficient soils never produce lawns, flowers or any thing else without constant fertilizing.

As a special top mulch in flower beds we recommend Shur Gro pulverized sheep manure. It is finely ground and contains no weed seeds. Conveniently packed in hundred pound paper-lined bags it does not get lumpy or lose its strength. You will find it priced under fertilizers.

GRAFTING WAX

At this time of year many orchardists are planning to do their grafting. Good wax is very essential to successful grafting. We carry a high grade Wax and are in position to supply you in any quantity.

KNOX'S QUALITY SEEDS

SEEDOLOGY

PUBLISHED BY KNOX SEED CO.

Vol. 1 EARLY SPRING 1929 No. 2

THE HIGH COST OF CHEAP SEEDS

Probably no other method of false economy is as ruinous as buying cheap seed. A year's work, loss of land, loss of credit, waste of water, labor and time may all result from poor seed. It takes just as much effort, time and money to plant poor seed as it does good seed. The cost of the best seed is only a few cents more than the cheap, and figured on an acre basis never amounts to much.

The cost can generally be figured in the crop as the difference of one more sack, crate or hundred pounds of the crop you are growing. The growing of good seed is the work of an expert, and many of them have taken years to perfect the strain and varieties now offered to the public.

A crop of lettuce seed usually is the result of five or six years' line breeding from a single plant. Constant vigilance is needed to see that the strains are kept true and all sports must be removed from the field. The seedman of today must sell good seeds or he cannot survive. The good seedman sells only the very best regardless of price because he knows that cheap seed is dear at any price.

KNOX'S, THE POULTRY SUPPLY HOUSE

For a number of years we have maintained the largest stock of poultry supplies in Stockton. If it pertains to Poultry we have it. If not we will get it for you. Such lines of Poultry remedies as Conkey's, Hess's, Pratt's, Germa and McClelland's, are always in stock. Turn to the poultry supply list and see for yourself the complete line of accessories. We would appreciate a chance to serve you in any of your poultry needs.

"Brown's" new Auto Sprayers are the latest thing in sprayers for the poultryman and gardener. Come in and let us show you their remarkable features.

Viola Cornuta

NEW YORK LETTUCE.

The great fields of lettuce now grown on the Pacific Coast are planted exclusively with the variety known among Seedsmen as New York.

Some 80,000 acres of New York Lettuce was grown on the Pacific Coast in 1928, and about 50,000 car loads were shipped to all parts of America, in refrigerator cars averaging 320 crates to the car and each crate containing 4 or 5 dozen heads, all carefully trimmed and packed in attractive style.

Growing New York Lettuce for Market and Shipping.

The method for field culture usually employed on the Pacific Coast in growing lettuce for shipping is the "ridge" system. A bed is formed by running a furrow every 42 or 48 inches with a tool called a lister. This allows for the irrigation furrows and the lettuce bed. In the bed thus formed the rows of lettuce are sown 14 to 16 inches apart and the irrigation water is run down the ditches as often as necessary, which means that the soil should always be kept moist but not too wet. When in about the fourth leaf the plants are thinned to one foot apart. From 1½ to 2 pounds of seed per acre is used.

Seed one or two years old is preferable to seed freshly harvested as it germinates more uniformly and commands a premium in price. Some planters adhere to the belief that aged seed produces tighter heads and there may be some merit in this idea for crops maturing at certain seasons.

The time for sowing the seed for market crop varies, but crops are grown on the Pacific Coast practically the year round.

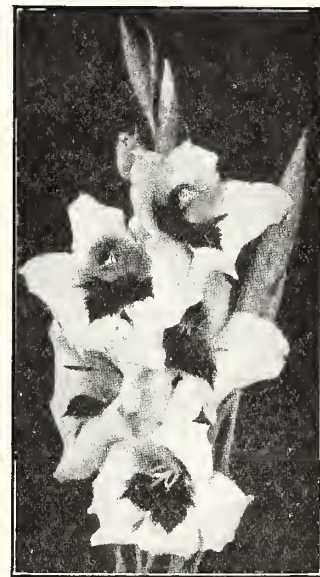

A market lettuce crop produces
(Continued on Page Four)

GLADIOLUS

A Sure Bloomer.

Few flowers offer as easy a solution to the flower garden as Gladiolus. They can be planted nearly anywhere in almost any type of soil and are sure to bloom with satisfaction. The bulbs multiply very rapidly and with a small start in a few years you can have a garden full.

They are found in nearly every shade and color of the rainbow and

will produce tall strong spikes of exceptional size. The bulbs should not be planted less than three inches deep. If planted too shallow they will get top heavy and fall over pulling the bulbs out by the roots. Plant the bulbs about six inches apart to secure a good effect. Gladiolus bulbs should be taken up every year as dozens of bulblets form on the bottom of the mother bulb and gradually force the bulb to the surface. The bulblets, if planted, will bloom the second or third year.

Be sure and start a Gladioli bed in your garden this spring. You will find a list of the popular varieties in the price list of this book.

SNAROL

For Snails, Slugs, Cutworms, Earwigs,
Grasshoppers, Sow Bugs—
How to Use It

The application of Snarol Meal should be made late in the evening, after thoroughly wetting down the infested area. Then apply Snarol by covering the wetted area with the sprinkling of the meal on the ground, and under the plants and shrubs. Particular attention should be paid to plants close to buildings and fences. Use freely. Do not expect Snarol to do the work with a light sprinkling here and there.

Snarol is not injurious to plants or other vegetation and is not soluble in water.

REX LIME AND SULPHUR SOLUTION

"The Standard for Over Thirty
Years"—"The Original"

Thirty years ago Rex Lime and Sulphur Solution was first offered for sale and at that time was the only similar commercial product on the market. Today it still maintains its leadership and is generally considered the Standard all round Insecticide and Fungicide.

Rex Lime and Sulphur Solution is the result of over thirty years research work and development carried out at several Rex plants located in various parts of the U. S. and Canada together with Rex Fellowship at the Mellon Institute of Industrial Research. This combined effort has developed a process which yields a product unexcelled in efficiency as an Insecticide and Fungicide and of uniform quality and stability. This process requires utmost care at all times and special chemical control in order that each barrel of Rex Lime and Sulphur Solution will contain the highest possible amount of active ingredients in their most efficient form. Rex Lime and Sulphur Solution is not merely a random mixture of Lime and Sulphur. It is manufactured from the highest grade of carefully selected raw materials combined in the Rex Process each step of which is under expert supervision. Progressive growers have found after years of experience that Rex Lime and Sulphur Solution is actually the most efficient and demand Rex for spraying their orchards.

There are many special brands and forms of Lime and Sulphur Solution now on the market and of varying efficiency. Rex Lime and Sulphur Solution contains very carefully balanced active ingredients which produce a spray of highest possible value. There is only one grade of Rex—the best. It would be possible to make changes in the formula and process which would yield a product of varying quality but in order to do so an entirely different Insecticide would result. Thirty years of experience have proved that the single Standard which has been adopted for Rex cannot be improved upon.

Formerly Rex Lime and Sulphur Solution was also sold in a dry form. However, it was found that there was a decrease in efficiency due to the drying process. Furthermore it was found that in order to produce a dilute spray with the dry product equal in active ingredients to the dilute spray made with Rex Lime and Sulphur Solution, the cost per tank when made with Dry was far in excess of the solution. For these reasons, Rex Lime and Sulphur in the dry form was withdrawn from the market.

Rex Lime and Sulphur Solution may

High Grade Northern Grown Seed Potatoes

be used for the control of many insects and fungus diseases. These include Blister Mite, Almond Red Spider or Brown Mite, Citrus Scale Insects, Peach Twig Borer, Curl Leaf, Peach Blight, Pear and Apple Scab, Mildew, Mealy Bug and Peach Rust and many other insect and fungus troubles. Rex Lime and Sulphur Solution may also be combined with oil sprays for the control of Hard Scale Insects such as: Brown Apricot Scale, Black Scale, Italian Scale and Oyster Shell Scale.

General Suggestions For Use

Semi-Dormant Period (early fall):
4 to 7 gallons Rex Lime and Sulphur Solution to make 100 gallons of spray.

Dormant Period (winter season):
7 to 12 gallons Rex Lime and Sulphur Solution to make 100 gallons of spray.

Late Dormant Period (early spring)
4 to 6 gallons Rex Lime and Sulphur Solution to make 100 gallons of spray.

Full Growing Period (summer season): 1½ to 2½ gallons Rex Lime and Sulphur Solution to make 100 gallons of spray.

BUCKEYE BROODERS —THE BEST

When you buy a brooder you want the best that you can get. Buckeye has made just that kind of brooders for a number of years. Whether it be coal, kerosene, or electric, Buckeye has that particular style and size you want. The new Buckeye "Rite-Heat" oil burning Colony Brooder created a sensation last year. It stands today as the most advanced type of brooder manufactured. It will handle large flocks of chicks and do it cheaper and better than any other brooder. It gives a tremendous amount of heat which is radiated down to the chicks evenly, to every inch of the brooding area, with greatest efficiency. Send for a new catalog in which this new brooder is described along with the many other Buckeye products. The low prices this year will surprise you.

SEED POTATOES

Best Quality Northern Grown

Few crops respond to good seed as readily as potatoes. All potatoes are not seed potatoes. They must be grown under ideal conditions with a great amount of care and supervision to produce what is a real good seed potato.

The man we buy most of our seed potatoes from has been growing them for a number of years. The potatoes that are planted to produce the next crop are carefully selected from heavy yielding hills. They must be uniform and of the proper shape with not too many eyes. They must also be absolutely free from disease. During the growing period the crop is inspected and, any off varieties are dug out to keep the strain pure. The potatoes are allowed to fully mature in the ground before digging. After digging they are sorted and put in proper storage till planting time.

You can easily see why good seed potatoes cost more money than the common commercial varieties offered as seed.

A difference of one sack in the yield or one sack of culls in the crop will generally pay the difference between good seed and poor seed besides your land will not be infested with disease.

The main varieties planted in this section are:

Extra early—
Garnet Chili.

Early—
Early Rose
American Wonders
Peerless
British Queen

Medium—
Wisconsin Pride

Late—
Burbanks
Quotations on application.

NEW YORK LETTUCE

(Continued from Page Two)

shippings heads in 65 to 90 days, depending on the weather conditions and also on the strain used.

New York lettuce is essentially a cool weather variety and sections of the coast are chosen for maturity during cool weather, so naturally Imperial Valley and Arizona produce winter crops and the cool coast climates in Salinas and the Pajaro Valley (Watsonville) produce mature crops in Spring, Summer and Fall. Such crops as are grown in the Sacramento or San Joaquin Valleys are timed to come off in the Spring.

Lettuce requires very good land, in fact the best land that can be procured. In the southern part of the State and in Arizona, sandy loam soil is used. In the vicinity of Salinas and Watsonville, heavy soil is preferred although not the heaviest sort of adobe.

Land for lettuce must be definitely controlled for irrigation and must be levelled and furrowed accordingly. Lettuce grown for market is seldom grown in large tracts, usually not more than 150 acres and frequently only 20 or 30 acres in a plot. These choice bits of land are usually leased by the lettuce planters and as high as \$75.00 per acre annual cash rent is paid for choice land.

Not only does lettuce growing demand the very best land but it must

be well supplied with water and the contour must be levelled and prepared for irrigation. No lettuce crops, so far as we know, are grown without frequent irrigation.

The crop must be frequently cultivated and as soon as dry enough to admit it, cultivation should follow irrigation or the soil will bake and become hard.

Sowing the seed is usually done when the top soil is barely dry and is not dependent on a rain to sprout the seed. In fact a rain is likely to pack the soil on top and prevent the young plants from coming up so that the land must be harrowed and the seed replanted.

The young plants should show in the row about ten days after sowing.

It is necessary to work the soil as fine as possible on the surface before sowing the seed since a rough surface with clods prevents a perfect stand.

If the weather permits a quick rapid growth the lettuce heads are apt to be of finer quality than if the plants are retarded in their growth in any way.

New York lettuce is subject to tip-burn and slime, both caused by weather conditions. Should the weather turn abnormally warm just as the head has reached the cutting stage it is quite likely to begin to rot or turn "slimy." Not only warm weather but a warm, windy day is likely to cause tip-burn. These conditions are not a disease like brown rust, which is prevalent in Imperial Valley and which

affects the crop in other sections to some extent.

The large planters of lettuce have found it best to keep lettuce growing on land only about three years, and as two crops are grown per year, this makes about six crops. Land by this time has usually been rather exhausted for further lettuce crops and up to the present time very little fertilizing has been done.

Land that is somewhat infested with wild Morning Glory can be used for lettuce culture since lettuce makes a crop in from 65 to 90 days and when grown in the Spring or in the Fall, it is easy to keep ahead of Morning Glory with one extra hoeing. This has been a great boon to the farmers whose land would be quite valueless for some crops where it is infested with Morning Glory and other weeds.

The most up-to-date intensive cultivation is required for good lettuce, but in spite of all human effort the crop is dependent on the weather and sometimes the most promising crops "blow up," as the lettuce men say, meaning that the crop comes just to the heading stage and refuses to head, or after forming fine heads they begin to rot or turn "slimy." In either case there is nothing to do but chop up the fields with disc harrows and begin again.

Growing lettuce is one of the most critical kinds of farming and needless to say good seed or rather the best seed is demanded by the lettuce grower and shipper.
